- **Strong Overall Sales Performance**

The cricket bat portfolio generated approximately ₹4.73B in Net Sales across the full analysis period, indicating a strong multi-brand sales base.

- **2026 YTD Performance Remains Strong**

From January to August 2026, the business generated approximately ₹751.83M in Revenue, showing continued sales momentum in the current year.

- **Revenue Alone Does Not Tell the Full Story**

High Revenue does not always translate into high profitability. Discounts and product costs significantly impact the final Gross Profit.

- **Product Cost is a Major Profitability Driver**

The Sales-to-Profit Bridge shows that product cost has a much larger impact on profitability than discount in many cases.

- **Volume and Revenue Should Be Analysed Together**

A high-volume product is not necessarily the highest-revenue product. ASP helps distinguish volume-driven growth from price-driven growth.

- **Higher Price Does Not Always Guarantee Higher Revenue**

The Price vs Revenue analysis shows that premium-price bats do not automatically generate proportionally higher sales, highlighting differences in product demand and market acceptance.

- **Time-Based Comparison Makes Performance More Meaningful**

MTD, QTD, YTD and R12M analysis allows the business to compare current performance with the relevant previous period instead of viewing isolated numbers.

- **Like-for-Like YTD Comparison Improves Accuracy**

YTD performance is compared against the same elapsed period of the previous year, such as Jan–Aug 2026 vs Jan–Aug 2025, providing a fairer comparison.

- **Gross Margin % Provides Better Profitability Context**

Gross Profit shows the absolute profit earned, while Gross Margin % shows how efficiently Revenue is converted into profit.

- **Interactive Filtering Speeds Up Product Analysis**

Brand and product filters allow users to instantly review the selected bat, its specifications, KPIs, revenue performance and profitability in one place.
